Code of Conduct and Ethics

Responsible person: Rachel Harris
Published: Friday, February 1, 2008
ISBN: 9781 871101 45 X
Edition: 1st

Summary

This code replaces the Statements for Professional Conduct published in 2004. It outlines the principles required of a professional working in imaging or radiotherapy. It provides advice and guidance and requires staff to use their professional judgement to apply the principles to the various situations in which they practice and in their personal lives in order to maintain the widest public trust and confidence in the profession.

Introduction

About this code

This document and the principles inherent within, outlines the principles and precepts required of a professional working in the wide field of what is encompassed within the generic term ‘radiography’.

It is issued by the Society and College of Radiographers (SCoR) to give advice and guidance to radiographers. Radiographers should use their judgement to apply these principles to the various situations in which they practice and in their personal lives in order to maintain the widest public trust and confidence in the profession.

Radiographers are advised that this document is not an alternative but is an adjunct to the current Health Professions Council (HPC) Standards of Conduct, Performance and Ethics1 and must be used in conjunction with it and all other relevant HPC publications. The HPC is the regulatory body for a number of named health professions.

Whilst this document addresses the profession of radiography and radiographers, most aspects contained within it are pertinent to members of the wider radiography workforce (eg, student radiographers, assistant practitioners, trainee assistant practitioners and support workers). It is incumbent on this wider workforce to ensure that they apply these same principles and precepts within their own scope of practice to ensure the public’s trust in radiography service provision and thus also in the profession of radiography.

Legal framework in which radiographers practice

Under the Health Professions Order (2001) the terms ‘radiographer’, ‘diagnostic radiographer’ and ‘therapeutic radiographer’ are protected titles and can only be used by persons who have successfully completed an approved course leading to a diploma or degree in radiography and who
are registered with the HPC. Title protection is one way of assisting the public in the identification of those individuals who are not only registered with the regulatory body and subsequently accountable for the delivery of a wide range of radiographic services, but also meet the established standards of the profession. It is permissible for the term ‘student radiographer’ to be used as long as it refers to an individual who is at the time following a recognised degree course which leads to eligibility for full HPC registration as a radiographer.

Individuals using any of the protected titles relevant to radiography in all clinical specialities; (educational, research, managerial or industrial employment) must comply at all times with the current legislation and laws in their country of practice, with current best practice and with their employer’s reasonable policies and procedures.

Complaints, professional conduct and fitness to practice

The HPC, as the professional regulatory body, handles complaints concerning the professional conduct or fitness to practice of registrants. The Society of Radiographers is the body that handles complaints or considers matters of fitness to practice concerning members of the Society who are not regulated by the HPC.

The HPC and the Society of Radiographers will take into account adherence or otherwise to this code, by radiographers and the wider radiography workforce, in the event of any complaint received.

Expectations

The Society and College of Radiographers expect members of the profession to, at all times, conduct themselves in a manner that will maintain public trust and confidence in the profession as a whole. The reputation of the profession must never be put into jeopardy through the actions or behaviours of either its members or the wider radiography workforce. In addition, individual members of the whole of the radiography workforce have a right to expect to be treated with respect and to be free from threats, violence or verbal abuse.

Whilst this document addresses the ethical requirements of radiographers and, by implication, the radiography workforce, it is also intended to enable the public to know what to expect from the provision of radiography services and, as such, this document should be widely available.

Best practice

At the heart of best practice is a commitment to the health and safety of all service users: to integrity and honesty; to professional competence; to continuing self-development and to the development and maintenance of high standards of ethics and behaviour.

This document consists of four major areas of standards of ethical behaviour which underpin and sustain professional and personal conduct:

1. Scope of Professional Practice
2. Relationships with Service Users
3. Relationships with Professional Staff
4. Personal and Professional Standards

and which are further informed by the following five philosophical precepts of:

- Autonomy (respect for persons)
- Beneficence (doing good)
- Non-maleficence (not doing/preventing harm)
- Justice (fair treatment of persons/environment)
1. Scope of Professional Practice

As a member of the radiography workforce you must practice in a safe and competent manner within your own scope of practice based on education, competency, knowledge, extent of experience and registration.

Professional indemnity insurance is available through membership of The Society of Radiographers. There may be circumstances when public liability insurance is required, this would only be applicable for unusual conditions, for example, radiographers working as independent practitioners. You must seek to further the profession of radiography and to maintain public confidence in the profession.

1.1 Scope of practice of radiography

All radiographers have a responsibility towards users of your services and a unique individual responsibility for the optimisation of any ionising or non-ionising radiation dose to individuals and to the genetic inheritance of the public at large. You are required to abide by current legislation and healthcare policy.

1.2 Individual scope of practice

You must consider the requirements of your individual scope of practice and seek to develop and maintain your abilities, to recognise the limits of your competence and to practice within them. You must monitor your practice and any protocols you work within using evidence from audit findings and from the relevant research in order to develop best practice.

You will always be accountable for your actions, your omissions and your behaviours and need to be able to justify any decisions you take within your scope of practice. You should recognise any deficiencies you may have and take appropriate action to rectify them.

1.3 Development of the profession

You should endeavour to ensure that the profession of radiography continues to develop in all fields and specialities and look for opportunities where development is possible. With this in mind you should seek out and work with others in pursuit of this goal, bearing in mind that your main responsibilities are always to service users.
1.4 Individual role development

Opportunities for individual role development lie within the career progression framework. You must engage in educational planning relevant to your needs and the needs of the service arising from clinical practice. You should seek to become a reflective, self-directed learner; able to appraise recent relevant research and to discuss and review the evidence base with colleagues in a variety of situations. You should encourage colleagues and other members of the radiography workforce in their role development.

1.5 Competence and continuing professional development

You must develop and maintain high standards of competency in skills, knowledge, acquired attitudes and behaviour and must work within current legislative and employers’ frameworks.

You should actively engage in learning in a constant process of development through the integration of Continuing Professional Development (CPD) in your day to day practice. CPD is a requirement for registrants and therefore must be a planned activity which is evidenced.

Registrants must follow the HPC guidelines in Your guide to our standards for continuing professional development3.

1.6 Clinical supervision/teaching

You should be willing to be involved in the supervision, teaching, training, appraising and assessing of student radiographers, assistant practitioners and trainees. You also have a professional obligation towards the teaching and training of other healthcare professionals (HCPs) in some practice areas eg, radiographers may be involved in mentoring nurses or midwives in ultrasound training. When involved in any such activities, you need to develop the skills, attitudes and practices of a caring and competent teacher/trainer. You should be objective and honest when supervising, appraising, evaluating or assessing the performance of others as service users will be at risk if you describe as competent someone who has not yet met or maintained a satisfactory standard of practice.

1.7 Professional liability insurance

There are inherent risks arising from the wide practice of radiography so it is important that you have adequate insurance to cover these risks. Usually insurance coverage is vicariously undertaken by your employer as long as you practice within your own scope otherwise the vicarious liability of the employer may be negated. The SCoR, through its annual subscription, covers personal liability insurance for those members working in the UK or who are travelling and temporarily working abroad in all countries with the exception of the USA and Canada.

Radiographers undertaking imaging outside any recognised care management framework eg, social ultrasound scans arising from self-referrals are advised to obtain additional professional indemnity provision.

Radiographers who practice as independent practitioners must ensure that they have adequate vicarious, personal and third party liability insurance.

For further advice see SCoR documents Statements on Ultrasound Referrals and Professional Insurance Arrangements4 and Professional Indemnity Insurance Statement5.
2. Relationships with Service Users

You have moral and legal obligations to service users and a duty of care to all.

You should demonstrate respect for individual dignity, belief, culture and autonomy through a commitment to the principles of consent and confidentiality. You must neither engage in, nor condone, behaviour that causes physical, emotional or psychological distress or damage to anyone.

2.1 Provision of good care to service users

You must ensure equality of care to all with no discrimination (gender, age, disability, ethnic origin, race, religion, beliefs, marital status, economic status, lifestyle, sexual orientation). You should strive for a consistency of care at all times and in all situations.

You must not be judgemental of any service users and ensure that children and other vulnerable groups are protected.

You must recognise the limits of your competence, consider the provision of appropriate health educational advice and, when deemed appropriate, consult with and take advice from colleagues.

You should make good use of resources available to you and at all times optimise exposure to radiation.

2.2 Professional boundaries

You should, if practicable, avoid providing imaging or radiotherapy services to anyone with whom you have a close personal relationship.

In order to maintain professional boundaries, you must not use your position to enter into relationships that may exploit service users sexually, emotionally, socially, financially or in any other manner.

You must use your professional judgement as to whether it may be prudent to involve a chaperone for a particular situation involving a service user. Wherever possible, it is good practice to offer the patient the presence of a chaperone during certain intimate procedures (eg, transrectal or transvaginal examinations) whether or not you are the same gender as the patient.

Considerations of chaperoning should be annexed to patient consent for examinations and it is advisable to ensure that the patient agrees with, and understands the role of, staff that might be present during intimate examinations.

Conversations with service users which include references to sex, politics or religion should be avoided.

2.3 Communication

You should introduce yourself by full name and job title to any user of your service and ask individuals how they wish to be addressed (eg, you must not use first or given names without initially gaining permission).

You must listen and respect service users’ views, communicate clearly, openly and effectively and be conscious of their ability to make decisions for themselves.

You should identify individuals with communication difficulties and make adjustments to accommodate their particular problems (eg, if there are language difficulties you should use interpreters not family members wherever possible).
In addition, you should develop sensitivity to the different cultural needs of patients.

Good communication with vulnerable people such as the elderly or special needs patients is imperative; you must always listen carefully to them and respect their views.

2.4 Children
You have a professional and personal duty to safeguard and protect children and therefore should follow the SCoR guidelines in *The Child and The Law: the roles and responsibilities of the radiographer*.

2.5 Consent
You must satisfy yourself that the appropriate informed consent has been gained prior to undertaking any examination or procedure and follow the SCoR guidelines in Consent to imaging and radiotherapy treatment examinations: an ethical perspective and good practice guide for the radiography workforce.

2.6 Confidentiality
You must not share the medical or personal details of a patient/client with anyone except those healthcare professionals who are integral to the well being of the patient. Consent of the patient should be gained before sharing information with relatives, carers or whoever may accompany the patient.

You must neither misuse electronic mail nor discuss patients or their illnesses in a public place. Local policies and procedures should be followed with regard to the leaving of messages on telephone answering systems.

Service user confidence is imperative and you need to follow the SCoR guidelines in Consent to imaging and radiotherapy treatment examinations: an ethical perspective and good practice guide for the radiography workforce and the HPC guidelines in Confidentiality: guidance for registrants.

2.7 Infection control
You must ensure that you understand and follow the principles and practice of infection control and that you minimise the risks of cross infection. You should seek to advise service users and students on how to avoid cross infection and report instances where cross infection may arise from activities you have witnessed.

You should follow the SCoR guidelines in *Healthcare Associated Infections: practical guidance and advice*.

3. Relationships with Professional Staff
You are obliged to co-operate with carers, other healthcare professionals, hospital staff and social care professionals. You should seek to understand and respect their responsibilities, needs, skills and working practices to ensure the best interests of all service users and avoid inappropriate criticism of them.

3.1 Collaborative practice/collegiality
Frequently, you may work as part of a multi-professional team and you need to respect the skills,
knowledge and contributions of colleagues from other professions and other team members. You should communicate openly and effectively with team members, acknowledge their individual roles and avoid inappropriate criticism of them.

3.2 Responsibility for peer behaviour

Radiographers and the wider radiography workforce have responsibilities within the work environment to ensure the health and safety of service users and should seek to avert any inappropriate activity of colleagues or others. If you have a patient-safety concern, you must ensure you are aware of the procedures for ‘whistle blowing’ and must report serious breaches of behaviour and malpractice.

*The Public Interest Disclosure Act (PIDA) 1998* which came into force in July 1999 encourages people to raise concerns about malpractice in the workplace and will help ensure that the organisation responds by addressing the message rather than the messenger and resist the temptation to cover up serious malpractice.

You are covered by the Act and employing authorities will have a written policy outlining the Act and provide processes and stages for the reporting of suspected malpractice.

Malpractice includes, amongst other things, negligence, incompetence, breach of contract, unprofessional behaviour, danger to health and safety or the environment and the cover up of any such issues.

Should you have a reasonable belief that a malpractice has occurred, is occurring or is likely to occur, you must approach a manager or senior professional with your concerns and follow the employing authority’s procedures. Concerns you may have about staffing levels which may compromise patient safety must also be reported.

You should not use ‘whistle blowing’ procedures to resolve a personal or business dispute.

*You are encouraged to contact the SCoR and the Health Professions Council (HPC) for guidance about any malpractice concerns.*

3.3 Referrals

Radiographers may accept requests for clinical imaging from named, non-medically qualified, registered healthcare professionals who are acting in the capacity of referrer under IR(ME)R, provided that an up to date list of individuals entitled to act as a referrer is established, maintained and made available to radiographers by the employer. The referrer is required to have an understanding of IR(ME)R through appropriate training and experience. Further information is available from *Clinical imaging requests from non-medically qualified professionals (RCN, SCoR 2007)*. Where an individual undergoes an exposure following an invitation to attend an authorised national screening programme, there is no requirement for a named referrer.

In the role of IR(ME)R practitioner, radiographers must take the responsibility for the justification of a medical exposure and should refuse the referral if the procedure cannot be justified. Where and when appropriate, the radiographer should propose the use of a procedure involving non-ionizing radiation.

3.4 Delegation

If you delegate clinical procedures (eg, radiographers delegating to students or assistant practitioners), you must satisfy yourself that that person is competent to carry out the procedure; you will retain ultimate responsibility for the manner in which the delegated task is performed.

You must provide supervision commensurate with the level of competence of the person to whom
the procedure is delegated.

4. Personal & Professional Standards

You must conduct yourself with honour and dignity and demonstrate trustworthiness and integrity in both your personal and professional life in order to maintain the widest public trust and confidence in the profession.

4.1 Personal conduct & deportment

You should support the health and well being of yourself, your colleagues and your service users.

You must carry out all activities conscientiously and treat all persons with whom you come into contact with respect and dignity irrespective of their gender, age, disability, ethnic origin, race, religion, beliefs, marital status, economic status, lifestyle, sexual orientation or political viewpoint.

4.2 Further employment

It is not appropriate to have any other employment outside radiography or in any other capacity within your place of employment, if that employment conflicts and compromises your role in the radiography workforce or brings the profession into disrepute.

4.3 Personal health

You must look after your own personal physical, emotional and psychological health and avoid any contact or involvement with service users if you are ill, emotionally distressed or on medication which may affect your performance or judgement. If you identify the need for help related to your own personal health you should feel able to ask for it without fear of discrimination. You must follow the requirements of the employing authority with regard to the need to disclose any illness and/or disease which you develop which potentially places others, including service users, at risk (eg, if you have an infection which could harm others).

You should be aware of any risks which may lead to work related disorders and ensure that these are minimised. It is your responsibility to ensure that equipment and the working environment are appropriate to minimise such risks and to inform management if these are considered to be unsuitable.

4.4 Personal ethics

You shall not be required to become involved in any professional activity which you believe to be unsafe, illegal, unethical or detrimental to any service user.

4.5 Conscientious objection

You must report in writing to your employing authority, at the earliest date in your employment, any conscientious objection that may be relevant to your professional practice. You should explore with them ways in which you can avoid placing an unreasonable burden on colleagues because of this. Your right to conscientious objection does not exempt you from providing service users with full, unbiased information eg, prior to prenatal screening or testing.

You do not have the right to refuse to take part in any emergency treatment.
4.6 Respect for the law

You must keep within the law of the country where you live in all your professional and personal practices.

Radiographers are required to inform the HPC if they have received a police caution or have been charged with, or found guilty of, a criminal offence; this applies even if outside the country where they live or work.

If asked to act as a witness in a formal inquiry or litigation process related to an employment situation, you must make clear the limits of your knowledge and competence.

4.7 Integrity in research

You should either conduct research or be involved in research or its dissemination in order to further the evidence base of the profession. You must protect the interests and confidentiality of patients and ensure that you do not distort or misuse clinical and research findings.

4.8 Providing/publishing information related to services

Radiographers who provide independent professional services can advertise but must ensure that any advertising is factual, legal, decent, honest and truthful and does not misrepresent the services on offer.

If you do provide independent professional services you must be honest in the financial arrangements with individuals informing them of any fees/charges at the earliest time and informing them if the NHS is able to provide the same service free of charge.

You must not accept commission from third parties for recommending, when practicing, the purchase of goods or services related to your professional status.

4.9 Public accountability and respect for the environment (sustainability)

The radiography workforce has a responsibility to society, to tax payers, to the wider community and to the environment. You should demonstrate due regard for the sustainable management of resources at your disposal and should use resources as responsibly and efficiently as is practicable.

4.10 Record keeping

The radiography workforce is required to write reports and complete forms and other documents for a variety of tasks (e.g., curriculum vitae, radiological reports, student supervision, travel claims, locum or out of hours work) in professional and personal circumstances. You must carry out these tasks using integrity and honesty and ensure that records are protected from loss, damage, tampering or inappropriate access. You must comply with the current Data Protection Act. You should adhere to any pertinent standards related to record keeping as in Standards for the Reporting and Interpretation of Imaging Investigations11.

4.11 Uniform/work-based clothing

You should wear appropriate uniform or work-based clothing which meets the need to inspire confidence in your patients and to afford protection against cross infection risks and other health and safety considerations. Your employing authority will determine the nature of your work-based clothing which will also take into account the cultural and religious requirements of members of staff. You should follow advice given in Guidance on protective clothing/uniforms worn in clinical imaging and radiotherapy and oncology departments12.
